

When the system reads a string from a DATA statement, it converts an INVERSE comma to a regular comma. To enter an INVERSE comma, hit the INVERSE key and then the comma. Hit the INVERSE key one more time to get out of the INVERSE mode and back to normal mode.

If you should want to use an actual inverse comma as part of a data string, you've got a real problem. Let's hope you never want to do this.

Special Note: Unlike ATARI BASIC, Advan BASIC allows you to INPUT, READ, or INPUTLINE to an array variable:

```
10 INPUT A$(5%)
```
