

Entering long programs

When entering a long program you might get a NO ROOM error message. If that happens, you should save the program to the disk and then reload it using the following special format:

LOAD filename l

The l after the filename instructs the system to keep the main part of the program on the disk. Then you can continue typing in your program. LIST, DEL, etc. will work as before; however, when you next save, you must use a different name. Also you will need to keep this disk in the computer during the save. If you have a one disk drive system, you must save back to the same disk. However, you can use COPYFILE.COD to move the program to another disk.

KILL, RENAME, LOCK, and UNLOCK

Descriptions of the above commands are in the reference manual. Each one can be called directly from the BASIC without affecting the program in memory.
